Advances in endovascular therapies during the past decade have broadened the options for treating peripheral vascular disease percutaneously. Endovascular treatment offers a lower risk alternative to open surgery in many patients with multiple comorbidities. Noninvasive physiological tests and ...

Procedures for Treatment of Peripheral Artery Disease (PAD)

Peripheral arterial disease (PAD) is the narrowing of any of the arteries to the legs, kidneys, stomach, arms, brain, and other organs. This condition increases the likelihood of a heart attack or stroke. The most common symptoms of PAD include leg or arm discomfort while exercising, leg ulcers, and other serious complications, such as gangrene.

Endovascular Treatment of Peripheral Artery Disease (PAD ...

The first step to ensure a successful procedure is to plan appropriate vascular access. The majority of peripheral endovascular intervention can be performed from multiple arterial access sites (i.e., radial, brachial, femoral, or popliteal arteries). However, cases occasionally require a specific access to achieve a successful result.

Endovascular Treatment Of Peripheral Artery

Endovascular treatments are minimally invasive procedures that are done inside the blood vessels and can be used to treat peripheral arterial disease, or PAD, which is a common type of vascular problem in the leg, aorta or carotid.
