Governor (device) - Wikipedia

In a mechanical engine, a mechanical speed governor performs this function. Balance of forces. Within a mechanical governor, the speed demand lever creates a spring force working against a force based on engine speed. The balance of these forces controls the volume of fuel injected into the engine. Applying machine load to the engine slows the engine speed. This creates an imbalance in the governor forces, which causes an increase in injected fuel and develops higher engine power to control ...

A governor, or speed limiter or controller, is a device used to measure and regulate the speed of a machine, such as an engine. A classic example is the centrifugal governor, also known as the Watt or fly-ball governor on a reciprocating steam engine, which uses the effect of inertial force on rotating weights driven by the machine output shaft to regulate its speed by altering the input flow of steam.

Diesel Engine Generator Governors

A centrifugal governor is a specific type of governor with a feedback system that controls the speed of an engine by regulating the flow of fuel or working fluid, so as to maintain a near-constant speed. It uses the principle of proportional control.

Diesel engine generator governors are sometimes referred to as the speed controller for the diesel engine. The diesel engine must maintain a pre-determined speed to maintain generator output specifications. If the engine speed is not correct the generator will not maintain the required output specifications.

How do governors control the speed of an engine in ...

Diesel Engine Speed Governor. The power delivered by the alternator needs to be constant despite load variations and this depends to a great degree on the speed at which the prime mover of the generator diesel engine is rotating since the alternator is getting its movement from that engine only. Hence the role of the governor is equally important in this case as well.
