Microbial

oceanography - SOEST

At the end of the nineteenth century, marine microbiology emerged from the disciplinary melding of terrestrial microbial ecology, experimental physiology, and the then-nascent field of deep-sea biology.

Marine organisms are excellent models for studying basic biology principals. Ocean productivity is the amount of food produced by marine organisms and the number of organisms this food supports. The oceans cover less than half of the earth's surface. Today it is generally believed that animals cannot live below the lit regions of the ocean.

When Pasteurian
Science Went to Sea:
The Birth of Marine ...

While the oceans cover more than 70% of the Earth's surface, marine derived microbial natural products have been largely unexplored. The marine environment is a habitat for many unique microorganisms, which

A Gram-negative, yellow-pigmented, halophilic bacterial strain US6-1T, which degrades high-molecular-mass polycyclic aromatic hydrocarbons of two to five rings, was isolated from muddy sediment of Ulsan Bay, Republic of Korea. The 16S rRNA gene of the isolate showed high sequence similarity to *Novosphingobium subarcticum* (96.23 %)
